

Process & Decision Documentation

Project/Assignment Decisions

A key decision was requiring players to identify who they believe the killer is when reaching the exit door. Initially, my plan was for players to simply collect clues and automatically progress to the next level. However, I thought adding a decision-making step would make progression feel more rewarding and encourage players to actively engage with the clues rather than passively navigate the maze.

Role-Based Process Evidence

Brainstorming & Creating

Name: Aliza Lallani

Role(s): Sole contributor

Goal of Work Session

Working with GenAI to develop and program the levels.

Tools, Resources, or Inputs Used

- ChatGPT 5 Mini (free plan)
- Genmoji – used for generating the suspect images
- Emojipedia – used for player, clue, door, and killer icons

Sketch

While prompting ChatGPT, I sketched my idea to help me communicate my vision more clearly and identify any gaps I might have overlooked.

GenAI Documentation

Date Used: February 7th -8th, 2026

Tool Disclosure: ChatGPT 5 Mini, Genmoji

Purpose of Use: Coding guidance and image generation.

Summary of Interaction: The tools helped me transform my game idea into specific code and images.

Human Decision Point(s): I reviewed each GenAI suggestion, either accepting and implementing it, requesting specific modifications, or overruling it and deciding on a different path. Specific examples are noted below under *Decision Points & Trade-offs*.

Integrity & Verification Note: I reviewed the syllabus to ensure my GenAI use was appropriate and treated GenAI as a collaborative partner rather than a substitute, iterating until I achieved my desired output.

Scope of GenAI Use: GenAI was used to generate specific code snippets and clarify where to insert them, as well as images for the suspects. However, I maintained creative control, critically reviewing and refining the AI suggestions to fit my design goals. I also came up with the initial idea for the game on my own.

Limitations or Misfires: There were several instances where ChatGPT's code didn't behave as I expected, particularly when implementing the moving killer in Level 2. At times, the GenAI's suggested code would conflict with its previous suggestions, which broke the game's functionality and required multiple iterations to fix. With Genmoji, there were times when the images didn't fully match my prompts.

Summary of Process (Human + Tool)

- *[Human]* Brainstormed game ideas
- *[Human]* Prompt engineering
- *[Human + AI]* Adjusted Example code to match my chosen game idea
- *[Human]* Wrote clues
- *[Human + AI]* Generated suspect images
- *[Human + AI]* Organized code
- *[Human]* Tested code and adjusted details

Decision Points & Trade-offs

Three examples:

Initially, GenAI's code allowed a clue to display even if the killer caught the player on the same tile. I adjusted the logic so that only the killer popup appears, which makes more sense narratively.

GenAI also suggested clues like "Red gloves" or "Broken vase," which I found either too obvious or difficult to depict in Genmoji, so I decided to write the clues myself.

When Genmoji repeatedly failed to generate images matching my prompts, I had to adjust my clues. For example, in Level 2, I made the killer allergic to cherries instead of nuts because Genmoji couldn't render nuts correctly.

Verification & Judgement

With each change, I reviewed the project in the "Live Server" view and evaluated whether it supported the gameplay or detracted from it. I also iterated extensively with GenAI, refining or rejecting outputs that didn't align with my creative vision.

Genmoji

Genmoji doesn't provide transcripts, but I've included screenshots below showing how I generated one of the suspects as an example.
